4. The digestive system

4.2 The stages of digestion

4.2.9 Intestinal flora

BACTERIA

We typically associate bacteria with infectious diseases. In reality, only a few known bacteria actually cause disease. Most bacteria are actually very beneficial.

The digestive tract contains several hundreds of billions of bacteria. To put this into perspective, bacteria make up to 1 kilogram (that is 2.2 pounds) of your body weight. These bacteria form what is called the intestinal flora. This flora plays an essential role during digestion. In particular, it breaks down certain nutrients that the body cannot digest. Dietary fibre for example.

The density of bacteria increases gradually from the stomach to the large intestine. There are up to 1000 billion bacteria per gram of faecal matter, which means that there are about 10 times more bacteria in the digestive tract then there are cells in the body!

This intestinal flora consists of a unique ecosystem made up of several hundreds of species. Besides playing an important role in digestion, intestinal flora also helps maintain health and prevent the development of certain diseases.

INTESTINAL FLORA IN DIGESTIX

In DIGESTIX, the intestinal flora is the only digestive piece that has an impact on dietary fibres.

Answers

Most bacteria cause infectious diseases.

O True

Wrong! That's not the right answer.

False

Well done! Fortunately, most bacteria are inoffensive.

Bacteria are useless.

O True

Wrong! Bacteria are not useless.

False Well done! Bacteria ferment dietary fibre in

your colon.

What is the name given to the community of bacteria in the digestive tract?

O The intestinal fauna

Wrong! But it was good try.

O The intestinal flower Wrong! Try again!

• The intestinal flora Well done! That's right.

What effect does intestinal flora have on certain nutrients?

Fermentation

Well done! That's right.

O Hydration

Wrong! That's not the right answer.

O Absorption

Wrong! Try again!

Dietary fibre is digested.

O True

Wrong! That's not the right answer.

False

Well done! Dietary fibre is not digested, it ferments.

Where in the body are most bacteria found?

• In the intestines

Well done! That's right.

O In the stomach Wrong! That's not the right answer. O In the oesophagus

Wrong! There are more elsewhere.

The intestinal flora comprises hundreds of species.

• True

Well done! Intestinal flora is highly diversified.

O False Wrong! Try again!

How many bacteria are there in the body compared to the number of cells?

O The same amount

Wrong! It's more than that.

10 times more Well done! That's right! 0 100 times more

Wrong! It's less than that.
